## **1. INTRODUCTION**

The increasing usage of Internet has heightened the need for online job hunting. The key problem is that most of job-hunting websites just display recruitment information to website viewers. Students have to retrieve among all the information to find jobs they want to apply. The whole procedure is tedious and inefficient. In addition, many E-commerce websites, the most general application of recommendation algorithms, uses collaborative filtering algorithm without considering user's resume and item's properties in this case, that means students' resume and details of recruiting information. So we proposed an improved algorithm based on item-based collaborative filtering. The aim of the present paper is to give an effective method of recommendation for online job hunting. We hope to offering students a personalized service that can help them

find ideal jobs quickly and conveniently. In this paper, we present a survey of existing recommendation approaches that have been used for building the personalized recommendation systems for job seekers as well as recruiters. Also we have identified the challenges in building a job recruitment system as compared to recommendation systems in other domain. Even so, the sparsity of user profile can be obstructive, further studies on filling users' preference matrix with implicit behaviors will be summarized in our next study.

## 1.1 PROJECT OVERVIEW

In the last years, job recommender systems have become popular since they successfully reduce information overload by generating personalized job suggestions. Although in the literature exists a variety of techniques and strategies used as part of job recommender systems, most of them fail to recommending job vacancies that fit properly to the job seekers profiles. Thus, the contributions of this work are threefold, we: i) made publicly available a new dataset formed by a set of job seekers profiles and a set of job vacancies collected from different job search engine sites; ii) put forward the proposal of a framework for job recommendation based on professional skills of job seekers; and iii) carried out an evaluation to quantify empirically the recommendation abilities of two state-of-the-art methods, considering different configurations, within the proposed framework.

**Keywords: “Job matching, job seeking, job search, job recommender systems, person-job fit, LinkedIn, word embedding”**

We thus present a general panorama of job recommendation task aiming to facilitate research and real-world application design regarding this important issue. From the last two decades internet based recruiting platforms have become a primary channel in most companies for recruiting talents. Such portals decrease the advertisement cost, but they suffer from information overload problem. Job portals using traditional information retrieval techniques such as Boolean search methods are typically using simple word matching algorithms. The main issue of these portals is their inability to understand the complexity of matching between candidates' desires and organizations' requirements. Hence, a vast amount of

deserving candidates misses the opportunity to get an appropriate job. The recent recommender systems have achieved success in e-commerce applications. In order to improve the functionality of e-recruitment process, many recommendation systems approaches have been proposed.

## **1.2 PURPOSE**

With an increasing number of cash-rich, stable, and promising technical companies/startups on the web which are in much demand right now, many candidates want to apply and work for these companies. They tend to miss out on these postings because there is an ocean of existing systems that list millions of jobs which are generally not relevant at all to the users. There is an abundance of choices and not much streamlining. On the basis of the actual skills or interests of an individual, job seekers often find themselves unable to find the appropriate employment for themselves. This system, therefore, approaches the idea from a data point of view, emphasizing more on the quality of the data than the quantity.

## **2. LITERATURE SURVEY**

### **1) Dynamic User Profile-Based Job Recommender System**

#### **Approach/Methodology:**

The basic features are extracted from the job seeker's profile. The profile might get out-dated when the user does not update it in a timely manner. Based on the behaviors of the job applicant and the previous jobs which he/she applied for, the dynamic features are extracted which is an updated version of basic features. So, the system makes a statistic at regular intervals, to generate the dynamic basic features. With the increasing number of applied jobs, the number of extracted features becomes greater. Information gain is calculated for each feature. More the information gain for a feature, the more important the feature is. The dynamic recommendation system works as follows: Initially for solving the cold-start problem, the user based collaborative filtering algorithm is applied to generate the initial recommendation jobs. After having the initial recommendations, the system provides the recommendations to the job seeker and records his behavior. The interested and uninterested jobs set is generated by analyzing the job applicant's behavior. Thus, the interested job set helps in extending and updating the user profile. Thus, the new basic features are used to calculate the similarity between the job applicant and job vacancies. So, new recommendations will be made available for the job applicant.

#### **Pros:**

Job applicants do not update their profile in a timely manner. This system aims at updating and extending the user profile dynamically based on the historical applied jobs and the behavior of job applicants.

**Cons:**

Besides the time and the dimensionality of features, there are other factors that affect the dynamic job recommendation system. The context formed in the peak season and the off season has an influence on the job desire of a job applicant. The drawback of this system is that it does not take these other factors into consideration.

**2) Temporal Learning and Sequence Modeling for a Job Recommender System****Approach/Methodology:**

The approach combines temporal learning with sequence modeling to capture complex user-item activity patterns to improve job recommendations. It is a time-based ranking model applied to historical observations and a hybrid matrix factorization over time reweighted interactions. Second, it exploits sequence properties in user-items activities and develops a RNN-based recommendation model.

**Pros:**

The Model is compared to two baseline models: randomized score (Rand) and recency-based sorting (TSort)

**3) Collaborative Job Prediction based on Naive Bayes Classifier using Python Platform****Approach/Methodology:**

The proposed method includes implementing a recommendation system based on the collaborative filtering technique for job portals. The system is designed to suggest the jobs to the user depending upon his profile and by calculating a

similarity index using Euclidean distance of two skill sets and then ranking them according to their naïve Bayes algorithm.

**Pros:**

It has small computational overhead compared to Machine learning models.

**Cons:**

Susceptible to cold-start problem

**4) Combining content-based and collaborative filtering for job recommendation system: A cost-sensitive Statistical Relational Learning approach**

**Approach/Methodology:**

Developed a hybrid content-based filtering and collaborative filtering approach. The approach adapted a successful Statistical Relational Learning algorithm for learning features and weights and is capable of handling different costs for false positives and false negatives. The hybrid recommendation system is constructed by learning the Relational Dependency Network using a state-of-the-art learning approach—Relational Functional Gradient Boosting.

**Pros:**

Prevents the necessity for exhaustive feature engineering or pre-clustering and provides a robust way to solve the cold-start problem.

**Cons:**

Markov Logic Networks with Alchemy2 fail due to large amounts of data.

## **5) A Combined Representation Learning Approach for Better Job and Skill Recommendation**

### **Approach/Methodology:**

The proposed solution is representation learning based that leverages information of three graphs in order to represent each job and skill into a shared low-dimensional vector space for solving the job recommendation task from the historical job data:

### **Pros:**

The proposed embedding methodology consistently outperforms three state-of-the-art methods in terms of job recommendation task, which improves HR, NDCG, and pair-wise AUC by 3.4%, 6.7%, 1.2%, respectively.

### **Cons:**

The proposed representation learning framework is transductive, i.e., it learns representation vectors of jobs and skills that are available in the input graphs and new job titles and skills are not suggested.

## **6) Job Recommendation based on Job Seeker Skills: An Empirical**

### **Study Approach/Methodology:**

The skills are extracted from the job seeker profiles using various text processing techniques. Job recommendation is performed using TF-IDF and four different configurations of Word2Vec over a dataset of job seeker profiles and job vacancies. A group of nearest job offers based on distance to the job seeker's profile is selected (job matching). In the case of TF-IDF representation, cosine distance is used, while for word embeddings, the new Word Mover's

Distance(WMD) is used. Once retrieved the top "k" job offers for the profile, they are sorted in descending order based on the inverse of this distance(ranking)

**Pros:**

Personalized job recommendation is done based on the job seeker's profile. Recommendations based on other data like query based on keywords related to the job vacancy that the job seeker is looking for, etc. are less accurate than personalized job recommendations.

**Cons:**

TF-IDF computes document similarity directly in word-count space. It makes no use of semantic similarities between words.

Word2Vec model has an inability to handle unknown or out of vocabulary words.

## **2.1 EXISTING SYSTEM**

Existing system is not very efficient , it does not benefit the user in maximum way, so the proposed system uses ibm cloud services like db2, Watson virtual assistant , cluster , kubernetes and docker for containerization of the application.

## 2.3 PROBLEM STATEMENT DEFINITION

In the last years, job recommender systems have become popular since they successfully reduce information overload by generating personalized job suggestions. Although in the literature exists a variety of techniques and strategies used as part of job recommender systems, most of them fail to recommend job vacancies that fit properly to the jobseekers profiles. Thus, the contributions of this work are threefold, made publicly available a new dataset formed by a set of job seekers profiles and a set of job vacancies collected from different job search engine sites, put forward the proposal of a framework for job recommendation based on professional skills of job seekers, and carried out an evaluation to quantify empirically the recommendation abilities of two state-of-the-art methods, considering different

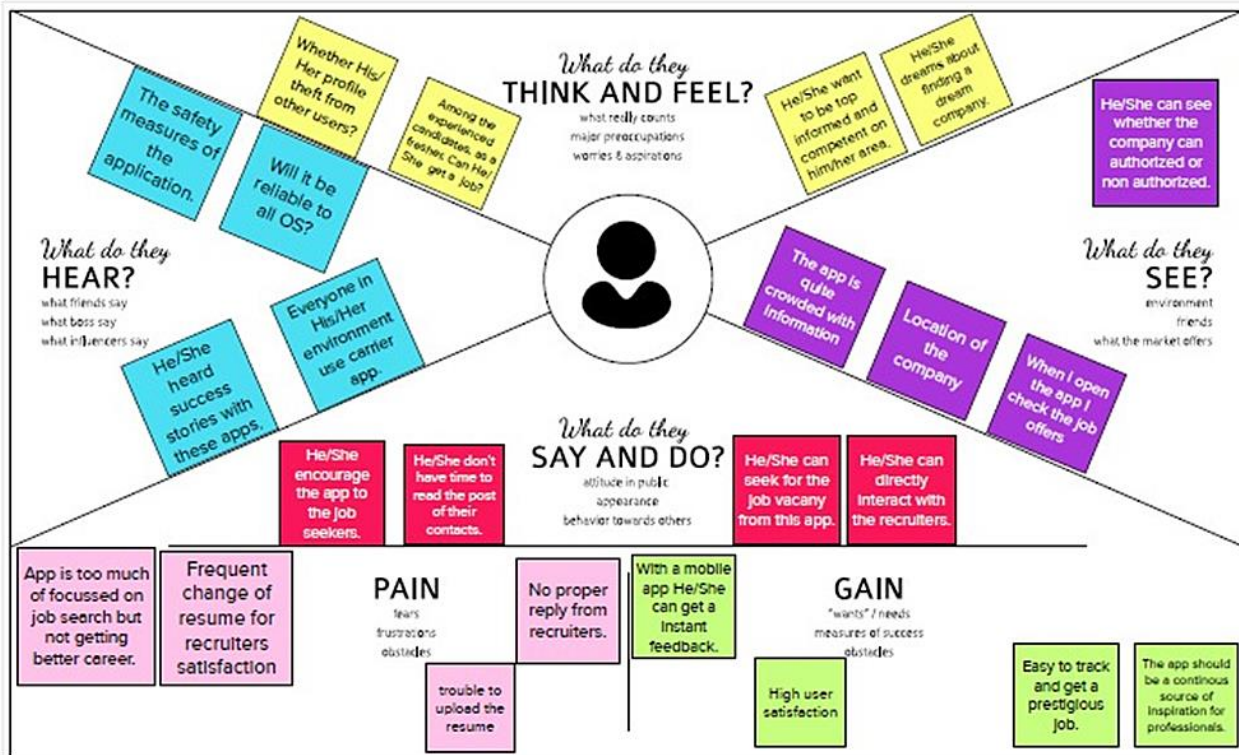

configurations, within the proposed framework. Thus present a general panorama of job recommendation task aiming to facilitate research and real-world application design regarding this important issue. Job matching, job seeking, job search, job recommender systems.

Proposed a framework for job recommendation task. This framework facilitates the understanding of job recommendation process as well as it allows the use of a variety of text processing and recommendation methods according to the preferences of the job recommender system designer. Moreover, we also contribute making publicly available a new dataset containing job seekers profiles and job vacancies. Future directions of our work will focus on performing a more exhaustive evaluation considering a greater amount of methods and data as well as a comprehensive evaluation of the impact of each professional skill of a job seeker.

### **3) IDEATION & PROPOSED SOLUTION**

#### **3.1 Empathy Map Canvas**

An empathy map is a collaborative tool teams can use to gain a deeper insight into their customers. Much like a user persona, an empathy map can represent a group of users, such as a customer segment. The empathy map was originally created by **Dave Gray** and has gained much popularity within the agile community.

### 3.2 IDEATION & BRAINSTORMING

**Ideation** refers to the whole creative process of coming up with and communicating new ideas. It can take many different forms, from coming up with a totally new idea to combining multiple existing ideas to create a new process or organizational system. Ideation is similar to a practice known as brainstorming.

**Brainstorming** sets the stage for the rest of the ideation process, so it's something you should approach with deliberate strategy. A typical brainstorming session involves one or more people directing their thoughts towards a particular problem or issue.

# Step 1

Template

## Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

🕒 10 minutes to prepare

🕒 1 hour to collaborate

👤 2-8 people recommended

### Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

🕒 10 minutes

#### Team gathering

Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.

#### Set the goal

Think about the problem you'll be focusing on solving in the brainstorming session.

#### Learn how to use the facilitation tools

Use the Facilitation Superpowers to run a happy and productive session.

Open article →

### Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

🕒 5 minutes

## PROBLEM

How might we help job seekers search for job vacancies?

How might we make the hiring procedure easier to select the best candidates for the job?

How might we make the job search customized?

How might we manage a large number of users simultaneously and effectively?

How might we provide a proper platform for recruiters to display job openings?

2

## Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

### TIP

You can select a sticky note and hit the pencil (switch to sketch) icon to start drawing!

3

## Group ideas

Take turns sharing your ideas. If sticky notes have been grouped, you can select a group of sticky notes, hit the arrow icon, and drag them to a new location.

20 minutes

### BARATH M

First I would analyse choice user.

Provided or suggested only trusted jobs.

User privacy guarded.

### BARATH RAJ T

We should prefer a worthy job.

The jobs and skills provided are really helpful.

Create the information should for when jobs are available.

### PRITHVI RAJ KUMAR K

The user able to determine skill.

Getting user choice.

It provides confidence for the user.

### SHANKARANARAYANAN B

Analysing the personal skills.

Watching the progress of other people.

Upgrade your job profiles.

## Security

User privacy guarded

User at pass sec

## Statement

How do we frame our problem statement? Frame your problem statement. This will be the basis for the entire session.

Remember to write over the base is a huge set of ideas.

## Brainstorming

Productive session

Encourage wild ideas.

3

### Group Ideas

Take turns sharing your ideas while clustering similar or related notes as you go. In the last 10 minutes, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

⌚ 20 minutes

TP

Add color-coded tags to sticky notes to make it easier to find, organize, categorize, and categorize sticky notes as ideas evolve over time.

## SUPPLEMENTARY FEATURES

Fake job offers detection and removal

Displaying of a match score for the candidate to know how much his skills match the job profile

Should provide information about the ongoing or upcoming job openings in various sectors. Also regular updates should be provided to the job seekers via email.

Job Seekers should be notified about the job application deadlines.

Timely reminders to the candidates regarding the deadlines of application process.

## PERSONALIZED JOB RECOMMENDATIONS

Job Seekers are recommended job roles based on the skills and experience listed in their resumes.

Job Seekers are recommended skills to gain and ways to strengthen their resumes based on their preferred job roles.

## RESUME PARSING

Resume extraction or resume parsing helps in analyzing, storing, extracting useful information from the uploaded CV automatically which helps in identifying the best applicants.

Efficient job recommendation to the job seeker by parsing his resume.

## JOB SEARCH

Filtering of candidates based on their skills

Job seekers should be able to search jobs by desired role, salary, location and should be facilitated with such personalized options that meet their needs.

## SKILLS ENHANCEMENT

Job seekers should be provided with a list of technical courses and certifications to choose from. These courses help job seekers to become skilled and industry ready.

Job seekers should be provided with knowledgeable insights to crack interviews.

## SOFTWARE SYSTEM DESIGN

Job Seeker should be able to bookmark any number of jobs that he is looking for and apply for it later on.

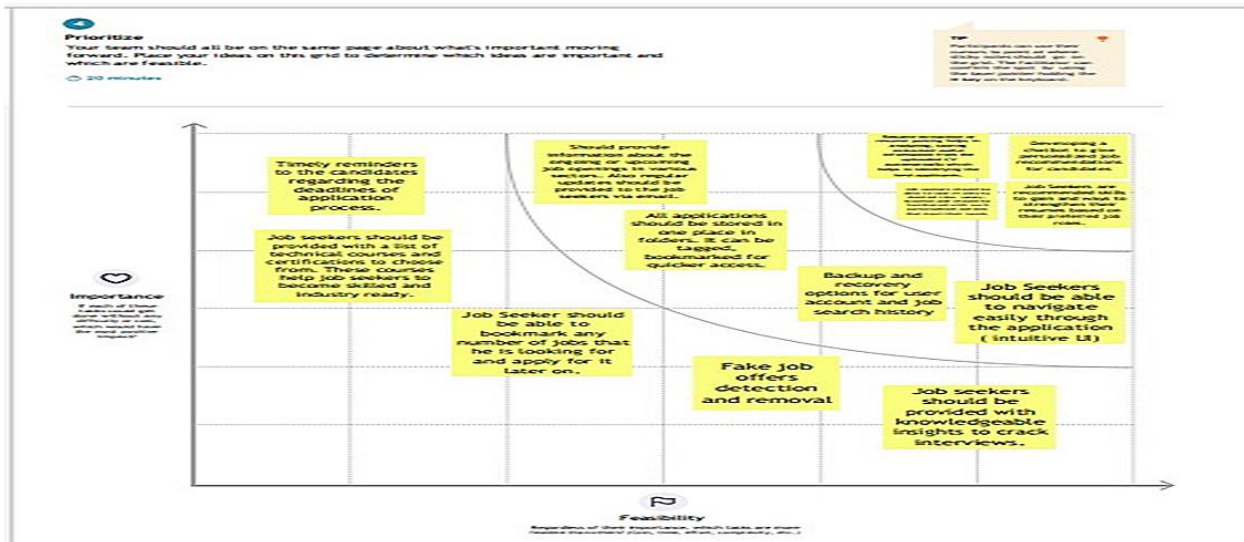

Developing a chatbot to give personalized job recommendations for candidates

All applications should be stored in one place in folders. It can be tagged, bookmarked for quicker access.

Efficient connectivity between job seeker and recruiter

Job Seekers should be able to navigate easily through the application (intuitive UI)

Backup and recovery options for user account and job search history

### 3.3 PROPOSED SOLUTION:

**Proposed Solution Template:**

Project team shall fill the following information in proposed solution template.

| S. No | Parameter                                | Description  |
|-------|--|--|
| 1.    | Problem Statement (Problem to be solved) | <ul style="list-style-type: none"><li>➤ Premium policy is an issue to the users.</li><li>➤ Look for field based jobs as searching for fields as a whole is time-consuming.</li><li>➤ Estimating salaries based on technical skills.</li></ul>                |
| 2.    | Idea / Solution description              | <ul style="list-style-type: none"><li>➤ Free access to every users.</li><li>➤ Filtering job by it's categories.</li><li>➤ Salary calculator for the estimation of the pay.</li></ul>   |

## 4. REQUIREMENT ANALYSIS

### 4.1 FUNCTIONAL REQUIREMENTS:

**Functional Requirements:**

Following are the functional requirements of the proposed solution.

| FR No. | Functional Requirement (Epic) | Sub Requirement (Story / Sub-Task)  |
|--------|-------------------------------|---|
| FR-1   | User Registration             | Registration via Form And via Gmail   |
| FR-2   | User Confirmation             | Confirmation through Email That is through OTP  |
| FR-3   | Chat Bot                      | A Chat Bot will be there in website to solve user queries and problems related to applying a job, search for a job and much more. |
| FR-4   | User Login                    | Login through Form<br>Login through Gmail   |
| FR-5   | User Search                   | Exploration of Jobs based on job filters and skill recommendations.   |
| FR-6   | User Profile                  | Updation of the user profile through the login credentials  |
| FR-7   | User Acceptance               | Confirmation of the Job.  |

**2 4.NON FUNCTIONAL REQUIREMENT:****Non-functional Requirements:**

Following are the non-functional requirements of the proposed solution.

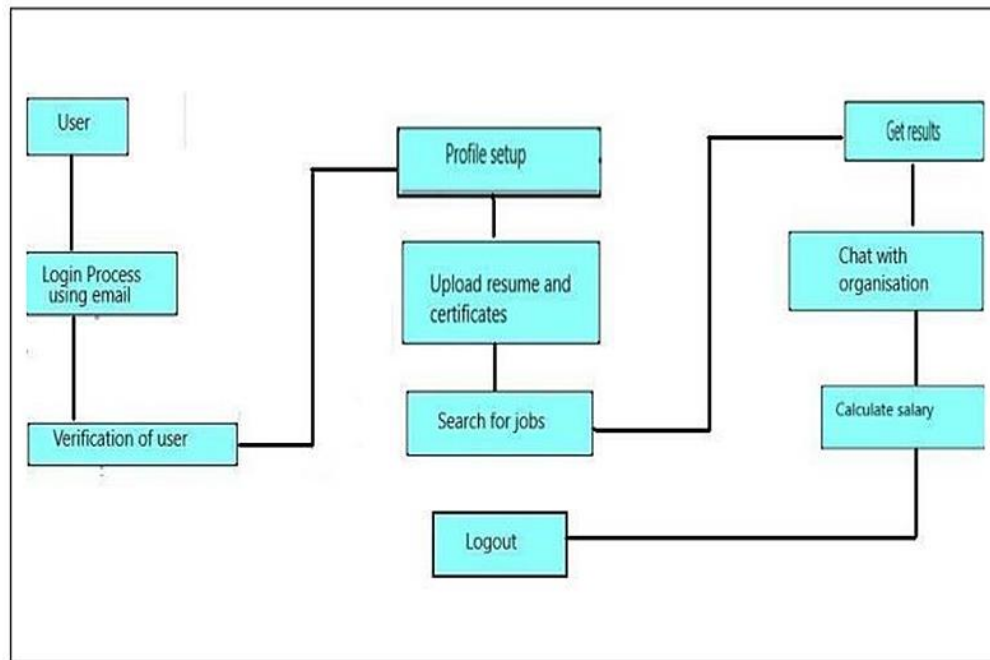

| FR No. | Non-Functional Requirement | Description   |
|--------|----------------------------|---|
| NFR-1  | <b>Usability</b>           | This application can be used by the job seekers to login and search for the job based on her Skills set.  |
| NFR-2  | <b>Security</b>            | This application is secure with separate login for Job Seekers as well as Job Recruiters.   |
| NFR-3  | <b>Reliability</b>         | This application is open-source and feel free to use, without need to pay anything. The enormous job openings will be provided to all the job seekers without any limitation. |
| NFR-4  | <b>Performance</b>         | The performance of this application is quicker response and takes lesser time to do any process.  |
| NFR-5  | <b>Availability</b>        | This application provides job offers and recommends Skills for a Particular Job openings.   |
| NFR-6  | <b>Scalability</b>         | The Response time of the application is quite faster compared to any other application.   |

## 5. PROJECT DESIGN

### 5.1 DATA FLOW DIAGRAMS

#### Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enter and leaves the system, what changes the information, and where data is stored.

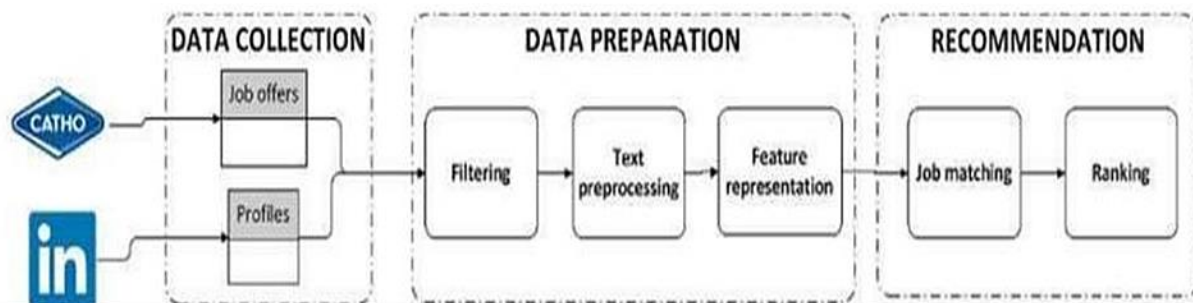

### 5.2 SOLUTION & TECHNICAL ARCHITECTURE

## Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

## Example - Solution Architecture Diagram:

## 5.3 USER STORIES

## User Stories

Use the below template to list all the user stories for the product.

| User Type               | Functional Requirement (Epic) | User Story Number | User Story / Task   | Acceptance criteria                                       | Priority | Release  |
|-------------------------|-------------------------------|-------------------|---|---|----------|----------|
| Customer (Mobile user)  | Registration                  | USN-1             | As a user, I can register for the application by entering my email, password, and confirming my password. | I can access my account / dashboard                       | High     | Sprint-1 |
|                         |                               | USN-2             | As a user, I will receive confirmation email once I have registered for the application.                  | I can receive confirmation email & click confirm          | High     | Sprint-1 |
|                         |                               | USN-3             | As a user, I can register for the application through Facebook.   | I can register & access the dashboard with Facebook Login | Low      | Sprint-2 |
|                         |                               | USN-4             | As a user, I can register for the application through Gmail.  |   | Medium   | Sprint-1 |
|                         | Login                         | USN-5             | As a user, I can log into the application by entering email & password.                                   |   | High     | Sprint-1 |
|                         | Dashboard                     | USN-5             | As a user, I can access my dashboard after signing in.  | I can access my account / dashboard                       | High     | Sprint-1 |
| Customer (Web user)     | Access                        | USN-6             | As a user, I can setup a profile, and basic details by signing in.  |   |          |          |
|                         |                               | USN-7             | As a user, I will upload my resume, certificates, and other requirements.                                 | I can perform several task in the application             | Medium   | Sprint-1 |
| Customer Care Executive | Chat bot                      | USN-8             | As a user, I can seek guidance from the customer care executive.  |   | High     | Sprint-1 |
| Administrator           | DBMS                          | USN-9             | As a administrator, I can keep the applications of your organization relies on running.                   | I can perform various modifications in the applications.  | High     | Sprint-1 |

## 6. PROJECT PLANNING & SCHEDULING

| Title  | Description  | Date                               |
|--|--|------------------------------------|
| Literature Survey and Information Gathering      | Gathering Information by referring the technical papers, research publications etc               | 2 SEPTEMBER 2022                   |
| Prepare Empathy Map                              | To capture user pain and gains<br>Prepare List of Problem Statement                              | 10 SEPTEMBER 2022                  |
| Ideation   | Prioritise a top 3 ideas based on feasibility and Importance                                     | 17 SEPTEMBER 2022                  |
| Proposed Solution                                | Solution include novelty, feasibility, business model, social impact and scalability of solution | 24 SEPTEMBER 2022                  |
| Problem Solution Fit                             | Solution fit document  | 29 SEPTEMBER 2022                  |
| Solution Architecture                            | Solution Architecture  | 1 October 2022                     |
| Customer Journey                                 | To Understand User Interactions and experiences with application                                 | 8 October 2022                     |
| Functional Requirement                           | Prepare functional Requirement   | 14 October 2022                    |
| Data flow Diagrams                               | Data flow diagram  | 15 October 2022                    |

## 8.TESTING

### 8.1 Test Cases:

We tested for various validations. Tested all the features with using all the functionalities. Tested the data base storage and retrieval feature too.

[illegible]

| Project Name  | Skills and Job Recommendation |
| Maximum Marks | 4 Marks                       |

### 1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the Skills and Job Recommendation project at the time of the release to User Acceptance Testing (UAT).

### 2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

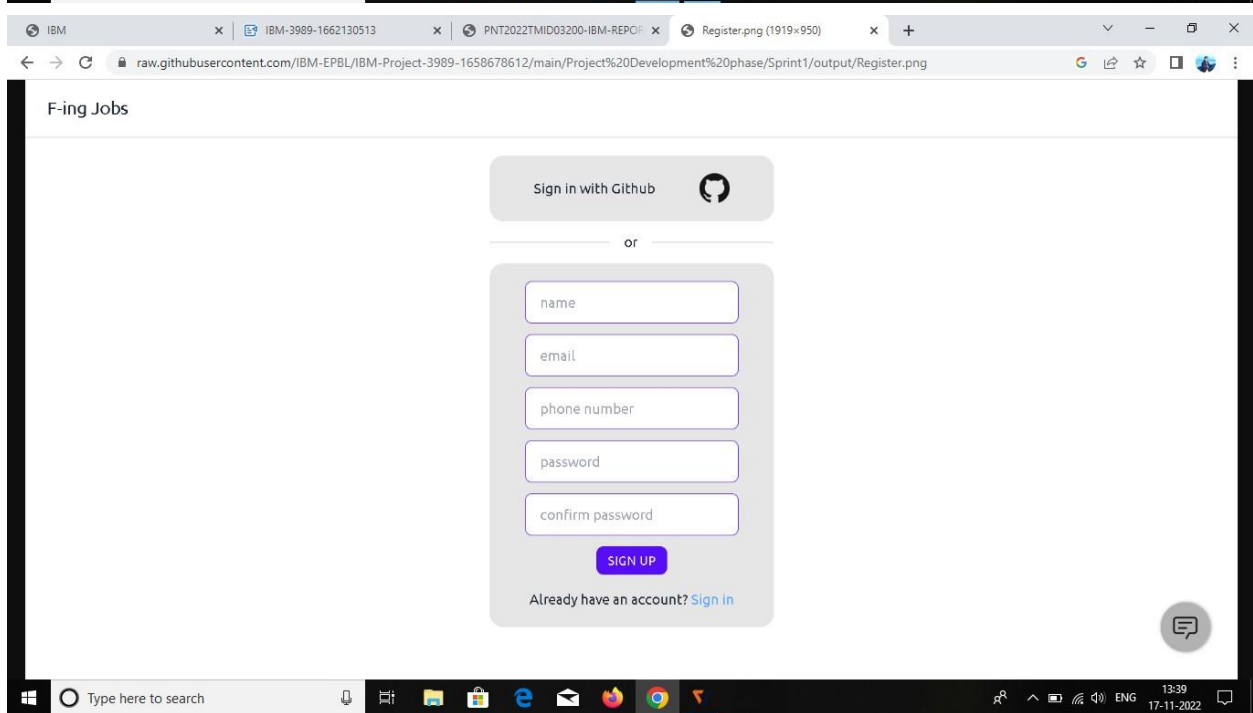

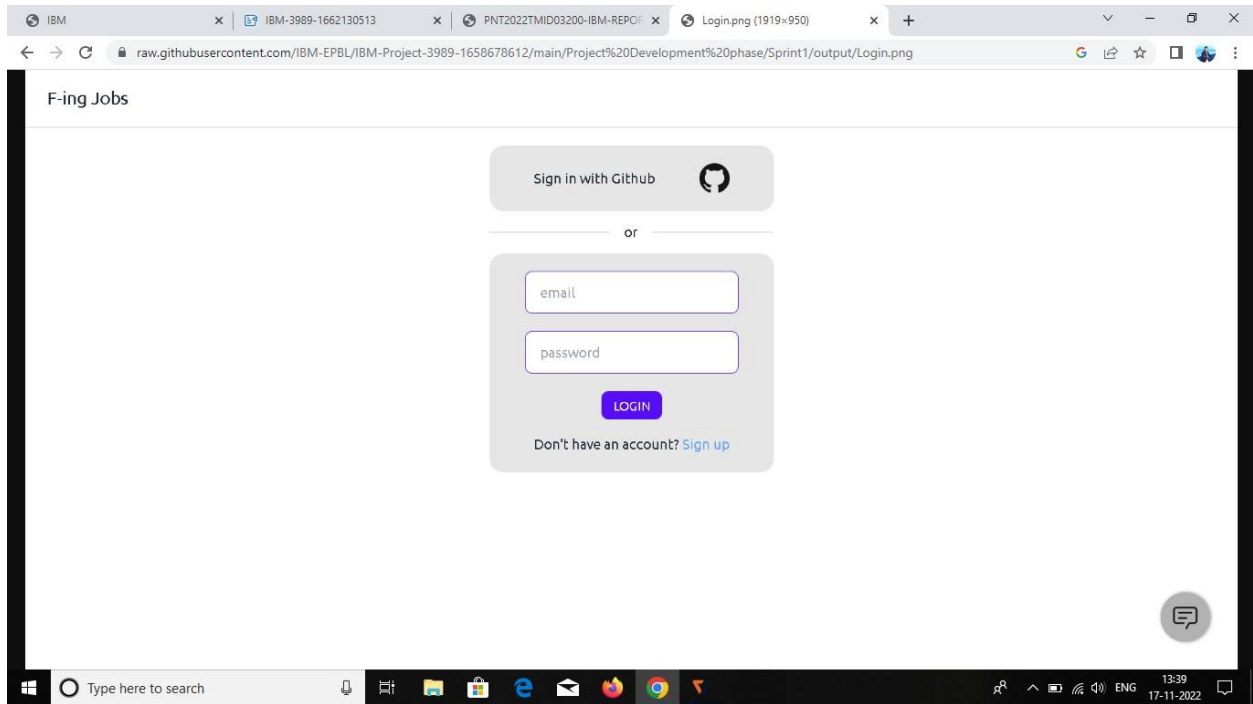

| Resolution     | Severity 1 | Severity 2 | Severity 3 | Severity 4 | Subtotal |
|----------------|------------|------------|------------|------------|----------|
| By Design      | 10         | 4          | 2          | 3          | 20       |
| Duplicate      | 1          | 1          | 3          | 1          | 6        |
| External       | 2          | 3          | 0          | 1          | 6        |
| Fixed          | 11         | 2          | 4          | 20         | 37       |
| Not Reproduced | 0          | 0          | 1          | 0          | 1        |
| Skipped        | 0          | 0          | 1          | 1          | 2        |
| Won't Fix      | 0          | 5          | 2          | 1          | 8        |
| Totals         | 24         | 14         | 13         | 26         | 80       |

### 3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

| Section            | Total Cases | Not Tested | Fail | Pass |
|--------------------|-------------|------------|------|------|
| Print Engine       | 7           | 0          | 1    | 7    |
| Client Application | 51          | 0          | 1    | 51   |
|                    |             |            |      |      |

JOB DESCRIPTION/JOB RESPONSIBILITIES

💬

## **10. ADVANTAGE AND DISADVANTAGE**

### **Advantages:**

#### **1. Employment Opportunities:**

The foremost advantage of having a profile in our application is that it is your doorway into employment opportunities worldwide. Before the advent of online job applications, students would get jobs through connections. However, now your job opportunities have increased magnanimously. Students who have attained education abroad can put in their area of specialization and find an appropriate job. Apart from this, if there is a particular company that you're interested in, you can make applications for the same.

#### **2. Easy Job Applications:**

The traditional recruiting process has taken a back seat and online job application has become paramount. Gone are the days, where you would have to run around with copies of your resume. With the ease of uploading the necessary information on your profile, not only will the recruiters peruse through your profile but you can update your skills regularly. The initial stress of a job application is reduced because the recruiter is already aware of your skills and wants to explore them further. This gives you an excellent opportunity to capitalize on the same and use the app to its fullest.

#### **3. Initiate Connections:**

Apart from receiving a job offer, the connections you establish on your profile help you in the long run. For instance, you may start by connecting with your school and college friends and eventually shift to your colleagues. An alumnus from your university is good connections to have. Having an illustrious list of connections speaks to your strong

profile. Having a connection who is working at your dream company can be your pathway to the same. Initiating connections will allow you to analyse industry trends and be at the top of the game.

#### **4.Endorsement and Connections**

Collecting endorsements and connections is an excellent way of adding social backing to your profile. As mentioned earlier, having illustrious connections will add value to your profile. Upon receiving endorsement for your skills, employers receive extra confidence in your profile. The trick now is to not only have relevant skills but also make your profile stand out.

#### **Disadvantages:**

##### **1. Risk of identity theft**

There are loads of personal information that you have to display on your profile for prospective employers to see. Hence, in a case whereby LinkedIn servers develop an issue, you stand a risk of losing important information to the public, resulting in identity theft.

##### **2. Incomplete profile challenge**

LinkedIn like other social network websites required you to put up an attractive profile. That is a profile that is appealing to employers and prospective recruiters. People however find it hard to fill out profile details

completely due to one reason or the other.

### **3. Tons of spam messages**

There's a saying that among 12 disciples there will always be a Judas. Think of how many Judas will be available on a website with over 1200 million people. LinkedIn is filled with spam messages from recruiters, employers, and even job seekers. All just to seek attention, mislead, and extort money, etc.

### **4. Premium package can be expensive**

Good thing they say doesn't come cheap. Although, LinkedIn allows you to join the platform without paying. But the LinkedIn premium packages are charged for. For example, the "medium-sized career" price is just about \$29.99/month. There are so many added benefits that this offer brings but can still be very costly for a starter or medium-sized business.

## 11. CONCLUSION

we have used ibm cloud services like db2, cloud registry , kubernetes , Watson assistant to create this application , which will be very usefull for candidates who are searching for job and as well as for the company to select the right candidate for their organization.

## 12. FUTURE SCOPE

Future directions of our work will focus on performing a more exhaustive evaluation considering a greater amount of methods and data as well as a comprehensive evaluation of the impact of each professional skill of a job seeker on the received job recommendation. We can use machine learning technicques to recommend data in a efficient way.
